

Assignment #1

1. Create a class “Room” which will hold the “height”, “width” and “breadth” of the room in three fields. This class also has a method “volume()” to calculate the volume of this room. Create another class “RoomDemo” which will use the earlier class, create instances of rooms, and display the volume of room.
2. Write a program to implement a class “student” with the following members.
Name of the student.
Marks of the student obtained in three subjects.
Function to assign initial values.
Function to compute total average.
Function to display the student’s name and the total marks.
Write an appropriate main() function to demonstrate the functioning of the above.
3. Implement a class for stack of integers using an array. Please note that the operations defined for a stack data structure are as follows: “push”, “pop”, “print”. There should be a constructor to create an array of integers; the size of the array is provided by the user.
Write a main() function to (i) create a stack to hold maximum of 30 integers; (ii) push the numbers 10, 20, 30, 15, 9 to the stack; (iii) print the stack; (iii) pop thrice and (iv) print the stack again.
4. Write a class “BankAccount” with the following instance variables:
AccountNumber (an integer), balance a floating-point number), and “ownerName” (a String).
Write proper constructor for this class. Also write methods balance, add (to deposit an amount), and subtract (to withdraw an amount) and implement them. Now create another class “AccountManager” that contains an array of BankAccount. Write methods create (to create an account), delete(to terminate an account), deposit (to deposit an amount to an account) and withdraw (to withdraw an amount from an account). Also write a class “Bank”, add main() function that creates an AccountManager and add 5 accounts. Now print the details of all accounts in this Bank.
5. Write a class to represent complex numbers with necessary constructors. Write member functions to add, multiply two complex numbers.
There should be three constructors: (i) to initialize real and imaginary parts to 0; (ii) to initialize imaginary part to 0 but to initialize the real part to user defined value; (iii) to initialize the real part and the imaginary part to user defined values.
Also, write a main() function to (i) create two complex numbers $3+2i$ and $4-2i$; (ii) to print the sum and product of those numbers.

6. Write a Java class “Employee” containing information name, id, address, salary etc. Write necessary constructor and read/write methods.
Create a class “Dept” that has a name, location etc. The “Dept” contains a number of “Employee”. Write methods “add” and “remove” to add and remove an employee to/from this department.
Write a main() function and create “Information Technology” department. Add five employees and print yearly expenditure for this department.
7. Create an abstract class “Publication” with data members ‘noOfPages’, ‘price’, ‘publisherName’ etc. with their accessor/modifier functions. Now create two sub-classes “Book” and “Journal”. Create a class Library that contains a list of Publications. Write a main() function and create three Books and two Journals, add them to library and print the details of all publications.
8. Write a class for “Account” containing data members ‘accountNumber’, ‘holderName’, ‘balance’ and add constructors and necessary accessor/modifier functions for these data members. Now create two class “SavingsAccount” and “CurrentAccount” extending from this class. SavingsAccount will have a member variable ‘interestRate’ and member function ‘calculateYearlyInterest’. Write another class “Manager” that contains a list Account. Also write a main() function to create an instance of Manager class. Add two SavingsAccount and three CurrentAccount to Manager. Calculate interest of each SavingsAccount. Print the details of all accounts.
9. Implement a class for a “Person”. Person has data members ‘age’, ‘weight’, ‘height’, ‘dateOfBirth’, ‘address’ with proper reader/write methods etc. Now create two subclasses “Employee” and “Student”. Employee will have additional data member ‘salary’, ‘dateOfJoining’, ‘experience’ etc. Student has data members ‘roll’, ‘listOfSubjects’, their marks and methods ‘calculateGrade’. Again create two sub-classes “Technician” and “Professor” from Employee. Professor has data members ‘courses’, ‘listOfAdvisee’ and their add/remove methods. Write a main() function to demonstrate the creation of objects of different classes and their method calls.
10. A bookshop maintains the inventory of books that are being sold at the shop. The list includes details such as author, title, publisher, cost and stock position. Whenever a customer wants a book, the sales person inputs the title and author and the system searches the list and displays whether it is available or not. If it is not, an appropriate message is displayed. If it is, then the system displays the book details and details and requests for the number of copies required. If the required copies are available, the total cost of the requested copies is displayed, otherwise the message “requires copies not in stock” is displayed. Design a system using a class called “Book” with suitable member methods and constructors.
